

# Knowledge Discovery from Land Record Systems

T. Shunnar & M. Barry

Technology in Land Administration :  
FIG Congress 2010  
Facing the Challenges – Building the Capacity  
Sydney, Australia, 11-16 April 2010

## Outline

- Introduction
- Problem
- Methodology
- Patterns in land records
- Fraud detection in post conflict situations
  - Simulation
  - Problem description
  - Problem formulation
  - Result
- Conclusions

# Introduction

Department of Geomatics Engineering

Schulich School of Engineering  
University of Calgary

Position Yourself Ahead of the Crowd

- Land Management Systems are accumulating vast amounts of data
  - land taxation records, personal details, survey plans, deeds, titles, building plans, property management files, maps, aerial photographs and satellite images
  - ICT facilitating major efficiencies in society in general (e.g. banking) but also providing opportunities for fraud e.g. identity theft, mortgage fraud
- Data Mining –potential to support land management systems?
  - Identifying errors.
  - Discovering fraud and other unusual behavior
  - Better search and analysis tools.

# Problem

Department of Geomatics Engineering

Schulich School of Engineering  
University of Calgary

Position Yourself Ahead of the Crowd

- Extracting knowledge from sizable land record systems using traditional search and analysis tools is often impractical.
  - Resources.
  - Error prone.
  - Hidden information

[www.geomatics.ucalgary.ca](http://www.geomatics.ucalgary.ca)

4 / 16

# Methodology

Department of Geomatics Engineering

Schulich School of Engineering  
University of Calgary

Position Yourself Ahead of the Crowd

## Identify

- What are the patterns?
- **Fraud**, Errors, Data analysis and decision support

## Study

- Reasons
- Representation in the data infrastructure

## Mine

- Data
- Technique
- Results

# Patterns in land records

Department of Geomatics Engineering

Schulich School of Engineering  
University of Calgary

Position Yourself Ahead of the Crowd

1. Fraud in Post Conflict Situations
  - Exceptional number of transactions
  - Transfers between members of different groups in the conflict
  - Privatization
2. Title & Mortgage Fraud
  - Appraisal fraud
  - Fraud by forgery
  - Oklahoma flip
  - Impersonation frauds
  - Air Loans
  - Title fraud

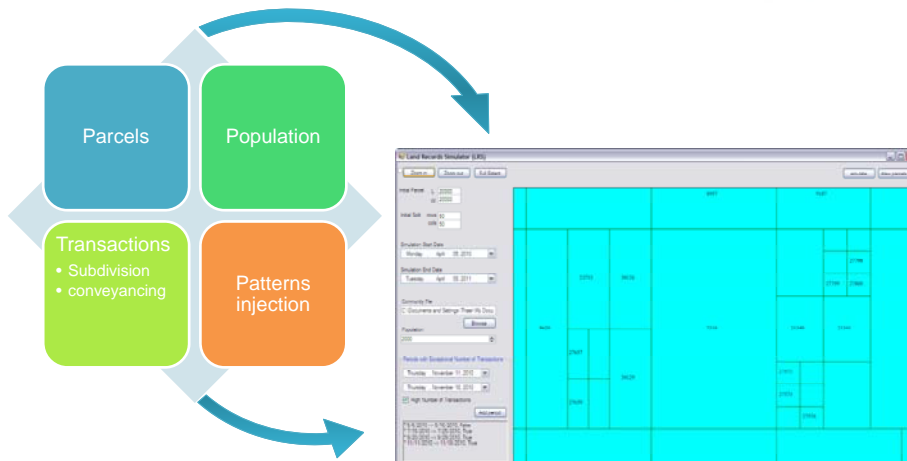

**We focus on experimental work related to exceptional transactions in this presentation**

[www.geomatics.ucalgary.ca](http://www.geomatics.ucalgary.ca)

6 / 16

- Detection of exceptional number of transactions that may take place during conflicts.

## Problem description

Department of Geomatics Engineering

Schulich School of Engineering  
University of Calgary

Position Yourself Ahead of the Crowd

- Detecting outliers in land transactions dataset
  - Simulate two types of outliers described by Zevenbergen and van der Molen (2004)
    - Unusually high number of transaction
    - Periods with no or few transactions
  - Entropy based outlier detection
    - Measures the level of organization in the data
    - Objective is to minimize entropy of the dataset

www.geomatics.ucalgary.ca

9 / 16

## Problem Formulation

Department of Geomatics Engineering

Schulich School of Engineering  
University of Calgary

Position Yourself Ahead of the Crowd

- Goal: find a subset of records such that removing this subset will minimize the entropy of the remaining set.
  - The size of the subset is predefined  $k$
  - The subset is to be called the outliers which may reflect fraudulent activities

www.geomatics.ucalgary.ca

10 / 16

# Results 1/4

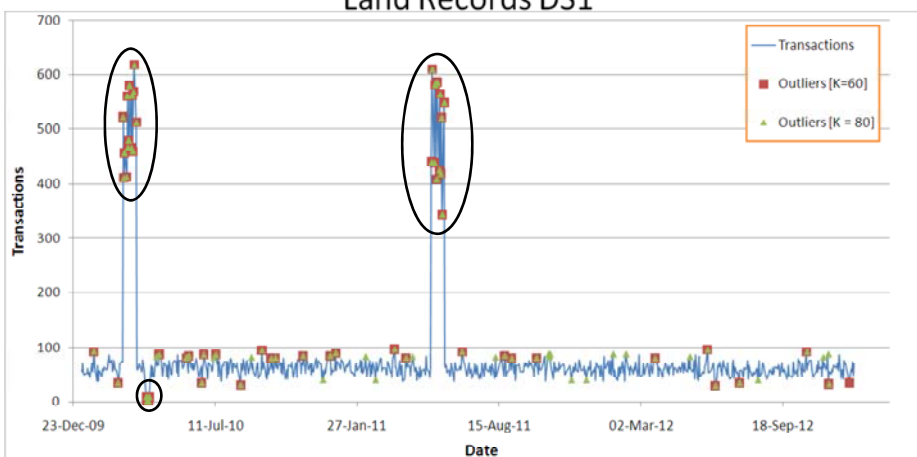

## Land Records DS1

Detected Outliers from LRDS1 for k=20 and k=40

# Results 2/4

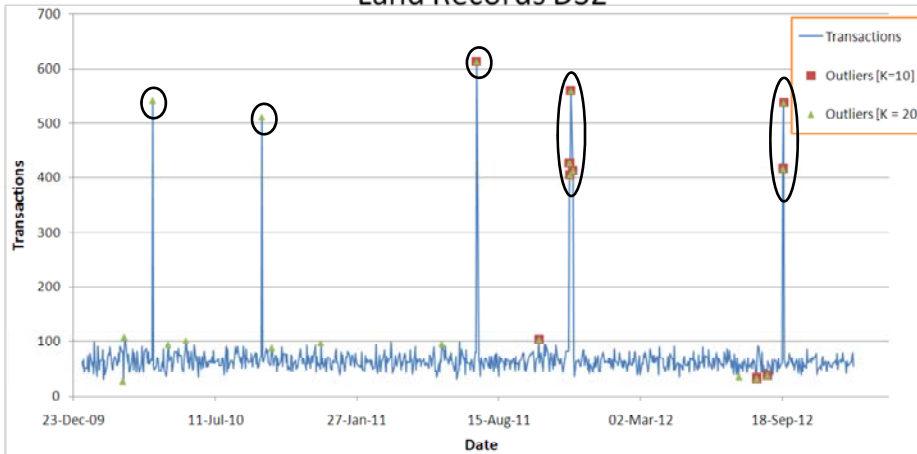

## Land Records DS1

Detected Outliers from LRDS1 for k=60 and k=80

# Results 3/4

## Land Records DS2

Detected Outliers from LRDS2 for k=10 and k=20

# Results 4/4

## Land Records DS2

Detected Outliers from LRDS2 for k=40 and k=60

## Conclusions

Department of Geomatics Engineering

Schulich School of Engineering  
University of Calgary

Position Yourself Ahead of the Crowd

- We identified a wide range of patterns in land and real estate transactions.
- Outlier detection could help in detecting fraudulent activities in land transactions that may take place during a conflict.
- A limitation of the entropy algorithm is the need for the pre-defined number of the wanted outliers  $k$
- The entropy algorithm was developed for simple one dimensional datasets.
- The goal is to build the model up and extend it to be applied on multi-dimensional datasets

## Algorithm

Department of Geomatics Engineering

Schulich School of Engineering  
University of Calgary

Position Yourself Ahead of the Crowd

```
Input:      D //land records dataset
           k //number of desired outliers

Output:     O //a subset of D with k outliers

Begin:
/* initialization of O */
  For counter equal 0 to k
    record = select a random record from D
    O[counter] = record
    remove record from D

/* evaluating the initial entropy */
  MinEntropy = Entropy(D)

/* iteration: minimizing the entropy for D */
  foreach record x in O
    foreach record y in D
      if Entropy(D-y+x) less than MinEntropy
        MinEntropy = Entropy(D-y+x)
        Swap x and y

End
```

## Entropy

Department of Geomatics Engineering

Schulich School of Engineering  
University of Calgary

Position Yourself Ahead of the Crowd

$$H(X) = -\sum_{x \in S(X)} p(x) \log p(x)$$

- $X$ : a random variable.
- $S(x)$ : the set of variables  $X$  can take
- $p(x)$ : probability function of  $X$
- $H(X)$ : Entropy
