- It is normal to have a lot of rain and storms in June in southern Alberta. Three causes:

1

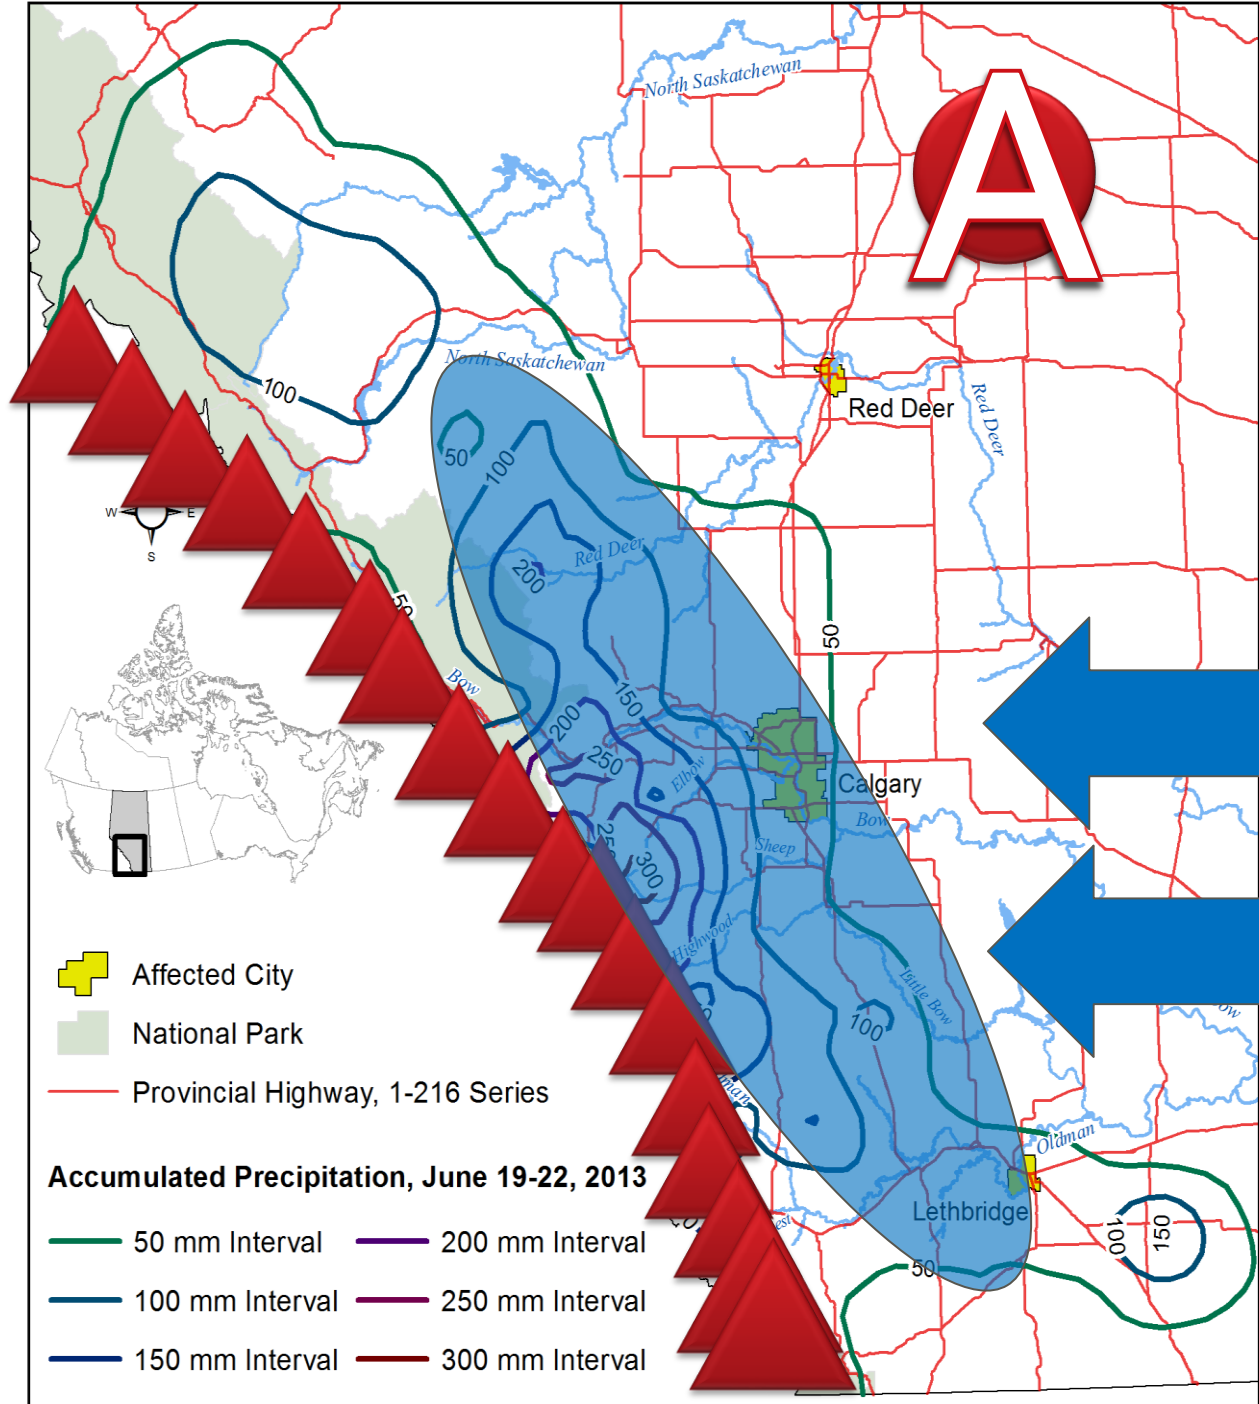

2

3

- Enhancement of building construction standards, including highways and bridges;
- Improvement of water management infrastructures;
- Support for owners who wish to relocate out of flood zones;
- Ban on building in floodway;
- Better mapping and understanding of flood risk.

- Governmental entity responsible to provide flood warnings to other agencies, the general public and industries;
- RFC wanted to supplement the current method of using local forecasts by implementing a wider watershed basins analysis;
- Needed a new tool:
  - Visualize and animate the various weather forecasting models as they become available from Environment Canada;
  - Analyze on demand weather forecast models in a selected watershed basin;
  - Keep a history of a week of weather forecasts.

Weather Model Selector

I want to...

Select the date and then choose the weather data model. Click on the "Get Data" button to view and animate the chosen model. To launch a statistical precipitation analysis for a single basin, click on the "Run Basin Analysis". The result will appear in another browser tab so please make sure that pop-ups are enabled.

- Web tool that fits RFC's needs of animating and analyzing weather forecast data based on water basins;
- Weather forecast layers available on the web application as soon as they are published by Environment Canada;
- Animation of time-aware layers in a web application;
- Raster analysis and charts generation.

# Sous le capot – analyse statistique

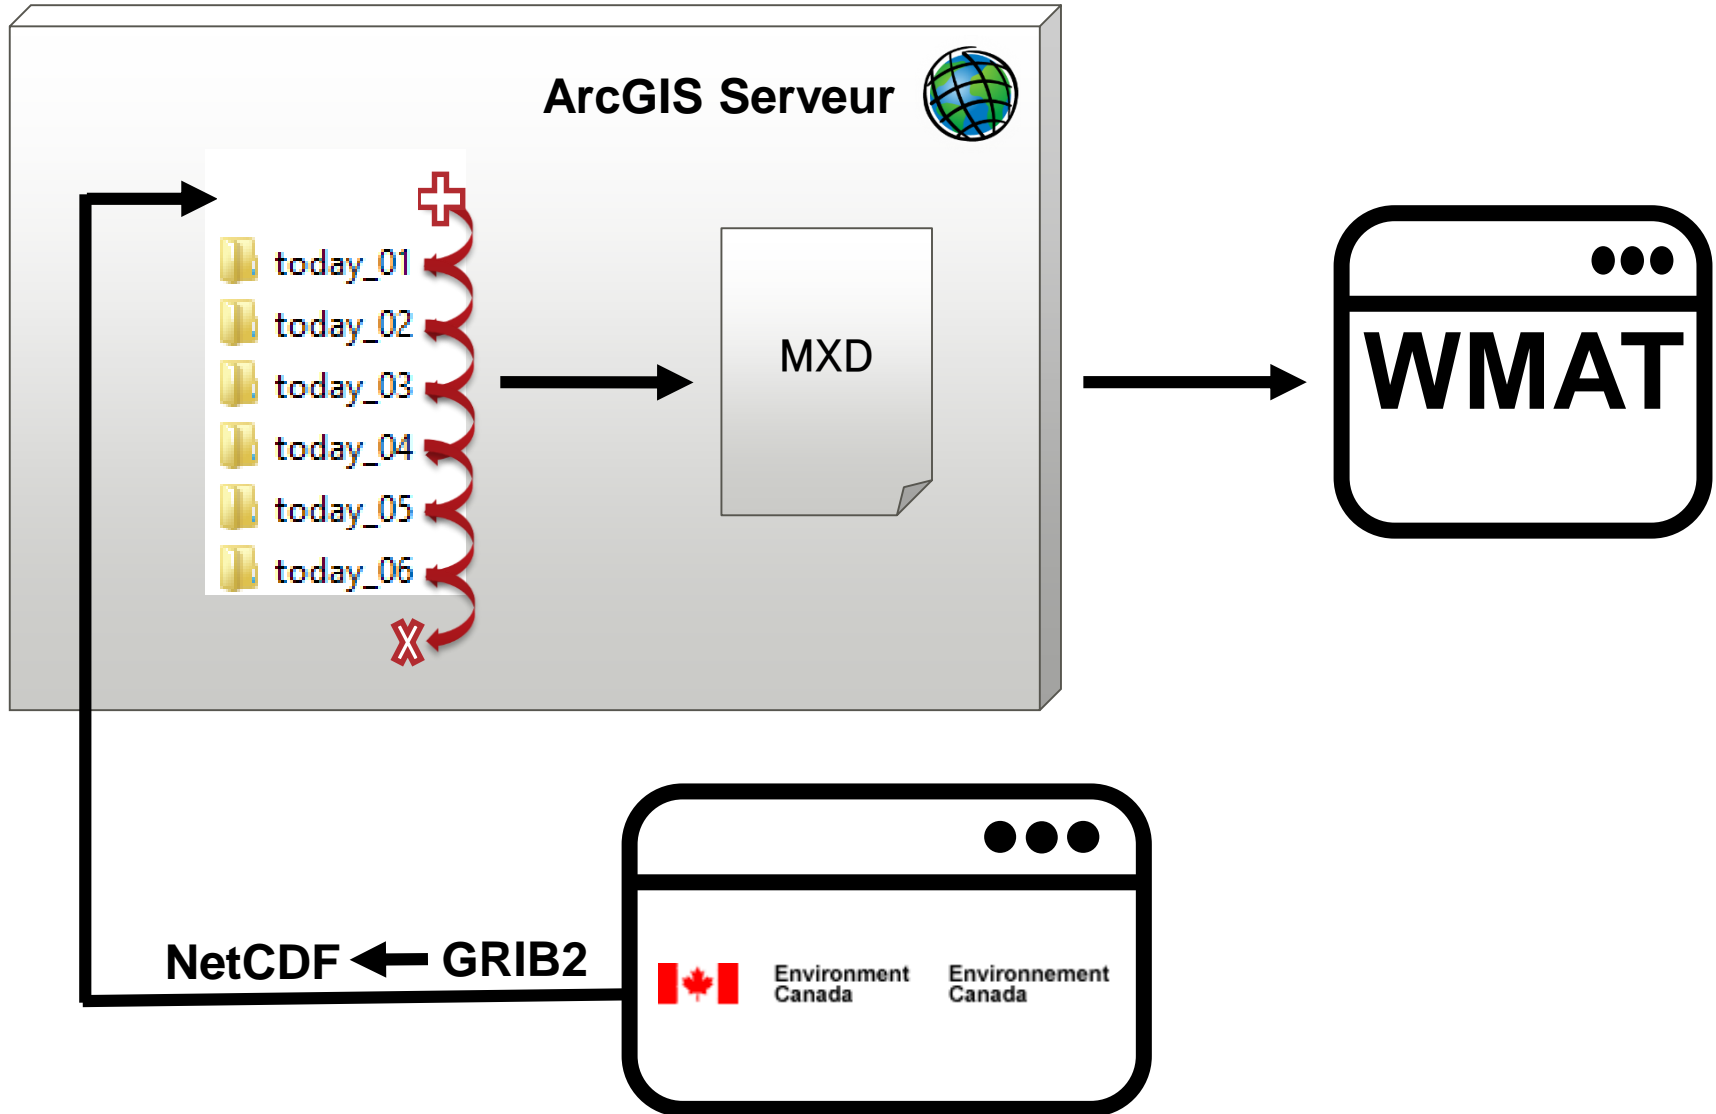

- Les géotraitements sont codés en Python (ArcPy);
- Le graphique est généré à l'aide de l'outil Open Source Chart.js

# Under the hood - architecture

## ■ Méthodologie Agile

- Rencontre avec les développeurs et les chargés de projet à chaque jour;
- Implication soutenue des clients dans le projet.

## ■ Métriques;

- 144 j-p
- 5 ressources
- 125K\$

Automatiquement:

1. Téléchargement plusieurs fois par jour de fichiers GRIB2 depuis le site d'Environnement Canada;
2. Utilisation de l'outil WGRIB2 de NOAA pour convertir les fichiers GRIB2 en NetCDF et les sauvegarder dans le dossier today\_00 (aujourd'hui);
3. À minuit à chaque soir, un script modifie les noms des dossiers contenant les fichiers NetCDF (today\_00 devient today\_01, ...).

# Sous le capot

Manuellement, une seule fois:

1. Téléchargement des données GRIB2 d'Environnement Canada pour une semaine;
2. Transformation  today\_00 32 en NetCDF par l'outil WGRIB2;
3. Création d'un  today\_01 ; toutes les combinaison possibles pour 7 jours;  today\_02  today\_03
4. Ajouter la com  today\_04 temporelle pour toutes les couches;  today\_05
5. Ajuster la sym  today\_06
6. Ajouter les couches de bassins versants;
7. Publier le MXD sur ArcGIS Server.
